

ANIMES RD

Social Anime Intelligence Platform

Product Pitch — Crunchyroll Partnership

Executive Summary

ANIMES RD is a **Social Anime Intelligence Platform** that transforms individual anime consumption into a rich, data-driven collective experience. Built around a core social graph of engaged users, the platform combines collaborative curation, behavioral analytics, controversy scoring, and a contextual AI agent to create a layer of social intelligence that no streaming platform currently offers natively.

We are seeking a strategic partnership with Crunchyroll to integrate or white-label this platform as a **community intelligence layer** on top of Crunchyroll's existing catalog and user base.

The Problem

Streaming platforms today solve *access*. They do not solve *decision*. Users face:

- **Discovery paralysis**: Thousands of titles, no contextual signal beyond generic recommendations
 - **Isolated consumption**: No visibility into what their actual social circle watches, rates, or debates
 - **No behavioral memory**: Individual ratings exist in silos with no social context or community benchmarking
 - **Missing controversy signal**: Users have no way to know which titles are divisive within their peer group before committing to watch
-

The Solution: ANIMES RD

ANIMES RD introduces a **social graph layer** on top of any anime catalog. The platform is built around five core pillars:

1. Collaborative Acervo (Shared Catalog)

A fully collaborative catalog where every member of a group contributes individual ratings, comments, and votes. Each title accumulates:

- Individual ratings per member
- Weighted group average
- **Controversy Score** — a proprietary metric measuring standard deviation across members, surfacing genuinely divisive titles
- Vote count and social validation signals

Live deployment: 192+ titles rated, with full controversy and behavioral data across 5 active users.

2. Social Analytics Dashboard

Real-time visual analytics including:

- Genre distribution by member and by group
- Top-rated titles with social consensus validation
- Scatter chart mapping average rating vs. controversy — a unique "debate map" of the catalog
- Member-level behavioral fingerprinting: dominant genres, average rating bias, exclusivity index

3. Collaborative Approval Queue

A structured pipeline for catalog expansion:

- Members submit new titles for group consideration
- Peer voting system with individual scores and comments before official catalog entry
- Automatic approval threshold logic
- Full voting history and audit trail

4. Ciel — Contextual AI Agent

An integrated AI agent trained on group behavioral data, capable of:

- **Personalized recommendation** by member profile, genre preference, and compatibility score
- **Controversy analysis** — identifying where a specific member diverges from group consensus
- **Backlog optimization** — ranking unwatched titles by predicted fit based on group ratings
- **Behavioral profiling** — classifying members as generous or strict raters, with data-backed justification
- **Cross-member compatibility** — mapping shared titles and opinion divergence between any two members
- **Group intelligence** — consolidated analytics across the entire social graph
- **Title lookup** — instant contextual data on any title in the catalog by name query

5. Member Identity & Profile System

Each member has a persistent profile with:

- Full watched history with personal ratings
 - Top-rated titles and favorite genres
 - Exclusive titles (watched by no other member)
 - Visual identity and customizable avatar
 - Opening playlist curation
-

Key Differentials vs. Existing Solutions

Feature	MyAnimeList	AniList	Crunchyroll (native)	ANIMES RD
Individual ratings	Yes	Yes	Basic	Yes
Group/social ratings	No	No	No	Yes
Controversy scoring	No	No	No	Yes
Peer approval queue	No	No	No	Yes
Contextual AI agent	No	No	No	Yes
Behavioral profiling	No	No	No	Yes
Social graph analytics	No	Limited	No	Yes
White-label ready	No	No	—	Yes

Technical Architecture

The platform is built on a fully modern, scalable web stack:

- **Frontend:** Vanilla JavaScript ES Modules, Chart.js, responsive PWA-ready
- **Backend/Database:** Google Firebase (Firestore) — real-time sync, horizontally scalable
- **Authentication:** Google OAuth via Firebase Auth
- **AI Layer:** Custom intent-based engine with behavioral data context (extensible to LLM integration)
- **Data Pipeline:** Automated export/approval workflow via GitHub Actions
- **Deployment:** Static hosting (GitHub Pages compatible, CDN-ready)
- **Mobile:** Fully responsive with dedicated mobile navigation, touch-optimized card layouts

Scalability path: Current architecture supports millions of users with zero infrastructure changes (Firebase scales automatically). The social graph model is group-agnostic — any community of any size can be onboarded.

Product Metrics (Current Deployment)

Metric	Value
Titles in catalog	192+
Active members	5
Average ratings per title	3.2 votes
AI interaction types	8
Pages / modules	12
Mobile optimization	Full (hamburger nav, card grid)
Theme support	Light + Dark mode
Data freshness	Automated daily sync

Partnership Proposal

We propose three integration models for Crunchyroll:

Option A — White-Label Integration

Deploy ANIMES RD as a **"My Group"** feature within the Crunchyroll app. Users invite friends, build a shared catalog from Crunchyroll's library, and access all social intelligence features natively. Crunchyroll retains full branding control.

Option B — Data Intelligence Layer

ANIMES RD provides Crunchyroll with a **behavioral analytics API** surfacing group-level signals — controversy scores, peer consensus ratings, social genre trends — to enhance Crunchyroll's existing recommendation engine with social context.

Option C — Standalone Acquisition

Full acquisition of the platform, codebase, and social graph model as a product extension for Crunchyroll's ecosystem.

Market Opportunity

- **Global anime market:** USD 25.7 billion (2023), growing at 9.8% CAGR
 - **Crunchyroll MAU:** 13 million+ subscribers
 - **Target cohort:** Friend groups and communities (3–20 users) who consume anime socially — an underserved segment in every existing platform
 - **Engagement multiplier:** Social features drive 3–5x higher engagement and retention vs. solo consumption platforms (Meta, Discord, Letterboxd precedent)
-

Why Now

The anime market is consolidating. Crunchyroll already won the access layer. The next competitive moat is **social intelligence** — knowing not just what a user watches, but what their community validates, debates, and discovers together.

ANIMES RD is that moat, already built and deployed.

Contact & Next Steps

We are available for a product demonstration, technical deep-dive, or partnership scoping call at your convenience.
